Installation Guide

To deploy this website properly to your hosting server, please follow these steps:

1. Go to your Cpanel to create a new database or use the existing one if you have. After that you import this file "db.sql" to your database.

2. Make sure you know your database server name (usually, localhost), username, password and database name clearly because you will use it later in the configuration.

3. Upload the website to the root directory of your hosting directory. Then go to your website folder → netiweb → config → database.php. Open this file and change these configuration to your database information.

```
$db['default'] = array(
    'dsn'      => '',
    'hostname' => 'localhost',
    'username' => 'root',
    'password' => '',
    'database' => 'neti',
    'dbdriver' => 'mysqli',
```

> Replace by your domain name.
>
> (http://www.netisolutions.biz)

4. Login to the admin page to change base url for your website. Please change "http://111.118.150.107:8888/neti" by your domain name ("http://www.netisolutions.biz"). That is DONE.
